

INDUSTRY-SPECIFIC INTELLIGENT FIRE MANAGEMENT SYSTEM

LITERATURE SURVEY:

The Purpose of this chapter to review the previous of Researchers on the INDUSTRY-SPECIFIC INTELLIGENT FIRE MANAGEMENT SYSTEM. This chapter will present the main recent works on the effects of Airline and Air Port services and to avoid delays in Air Travel across different locations at Municipality level.

An intelligent building incorporates two key components: automated building control systems and information management control systems. Automated building control systems include energy management systems, automated security and fire systems, and network life-support systems. Information management control systems include telecommunications, data networking, local area networks, and other short and long haul networks. When these systems are linked together with common wiring and central controls, the building becomes intelligent. The integration of these components in Infomart, a high-tech facility located in Dallas, Texas, is described. The usage of these components by tenants, and their possible application to library buildings are discussed.
